LAPAROSCOPY SPAY

www.sevillavet.com

INTRODUCTION

At Sevilla Veterinary Hospital, we provide advanced surgical options to ensure the best care for your pet. Laparoscopic spaying is performed by Dr. Pedraza, a former instructor of laparoscopic procedures. This guide explains why the procedure may be recommended, how to prepare, and what to expect during and after surgery. Our team is always here to answer any questions.

What is Laparoscopy Spay?

Laparoscopic spaying, or “keyhole spay,” is a minimally invasive procedure to remove a pet’s ovaries (or ovaries and uterus). A small camera (laparoscope) allows the surgeon to see inside the abdomen and operate through tiny incisions. The abdomen is gently inflated with carbon dioxide, and instruments are inserted through small tubes, reducing surgical trauma, pain, and recovery time compared to traditional spaying

What are the difference vs traditional spay?

Compared to traditional spaying, laparoscopic spay offers smaller incisions, less pain, lower risk of infection, and faster recovery. Traditional spay involves a larger incision, more tissue trauma, and longer healing time, while laparoscopy minimizes discomfort and allows pets to return to normal activity sooner.

LAPAROSCOPY SPAY

Surgical Process @ Sevilla Vet

01

PRE-OP CONSULTATION

Our pre-surgical consultation includes a pre-clinical examination of your pet and a free consultation with Dr. Pedraza. Same-day surgery may be available.

02

ADMISSION/PREP

Please ensure your pet has no food or water before surgery and has had a potty break prior to arrival. Drop-off is between 8–9 a.m. Our team will review the procedure, obtain consent, and your pet will receive an exam, possible bloodwork, and an IV catheter for anesthesia and medications.

03

LAPAROSCOPY SPAY

During a laparoscopic spay, a small camera is inserted through a tiny incision while your pet is under anesthesia. The ovaries (and uterus if needed) are removed using a vessel-sealing device to minimize discomfort. The small incisions are closed with absorbable sutures, and a protective bandage may be applied.

04

RECOVERY POST OP

After a laparoscopic spay, your pet is closely monitored as they recover from anesthesia. Most patients are comfortable and alert within a few hours and can be discharged the same day. You will receive a call with an update once your pet is awake and recovering well.

05

HOME RECOVERY

At home, keep your pet calm and restrict activity for 5–7 days after surgery. Sutures will absorb on their own, but it's important to keep the incision clean and prevent licking or chewing. Check the area daily to ensure it remains clean, dry, and healing well.

06

NEXT STEPS /FOLLOW UP

Most pets recover fully within a week and do not require further treatment. A follow-up appointment may be scheduled to ensure proper healing.

Further Info

(310) 310-3704

When to contact us:

- Swelling, redness, or discharge from the surgical site.
- Loss of appetite or lethargy.
- Vomiting, difficulty breathing, or unusual behavior
