TIBIAL PLATEAU LEVELING OSTEOTOMY (TPLO)

www.sevillavet.com

INTRODUCTION

At Sevilla Veterinary Hospital, TPLO is the most commonly performed surgery at our hospital, and our team has extensive experience treating cranial cruciate ligament (CCL) injuries with consistent, predictable results. Because we perform this procedure routinely, we have developed a highly refined surgical protocol, advanced anesthesia monitoring standards, and a team specifically trained in TPLO case management from start to finish. We use only premium, human-grade implant systems from Arthrex and Synthes to provide superior strength, precision, and long-term stability. Our goal is not just to stabilize the knee, but to restore comfort, mobility, and long-term joint health so your dog can safely return to an active, pain-free life.

What is a TPLO?

A Tibial Plateau Leveling Osteotomy (TPLO) is the gold standard surgical procedure for treating a torn cranial cruciate ligament (CCL) in dogs. Rather than replacing the ligament, the surgery changes the angle of the tibia to stabilize the knee, allowing your dog to comfortably bear weight without the damaged ligament.

What is the expected outcome?

Most dogs experience:

- **Significant reduction in pain**
- **Improved limb function and stability**
- **Early return to weight-bearing (often within days)**
- **Gradual return to normal activity over 8–12 weeks**
- **Excellent long-term function in the majority of patients**
- **Slowing of arthritis progression compared to untreated knees**
- **Return to an active, comfortable quality of life**

Owners are often surprised at how much happier and more comfortable their dog is after surgery.

TPLO SURGERY

Surgical Process @ Sevilla Vet

01

PRE-OP CONSULTATION

During your consultation, we perform a thorough orthopedic exam, review radiographs, and confirm that TPLO is the best option for your dog. We will discuss the procedure, recovery timeline, and answer all questions.

02

ADMISSION/PREP

Surgery drop-off is typically between 8:00–9:00 AM. A final exam and any necessary pre-anesthetic testing including bloodwork are performed prior to anesthesia.

03

TPLO PROCEDURE

The procedure involves adjusting the angle of the tibia and stabilizing it with a specialized bone plate and screws. We provide advanced pain control, including an epidural and a long-acting local anesthetic injection called Nocita placed directly in the incision site.

04

RECOVERY POST OP

After surgery, your dog is carefully monitored as they wake up from anesthesia and we ensure there are no anesthetic reactions before discharge. Pain control and comfort remain our top priority during recovery.

05

HOME RECOVERY

Strict activity restriction is required for approximately 6-8 weeks to allow proper bone healing. We provide detailed written instructions and remain available for support throughout recovery.

06

NEXT STEPS /FOLLOW UP

Follow-up visits and radiographs are scheduled to monitor bone healing and guide a safe return to normal activity. Our team will walk you through each phase to ensure the best possible outcome.

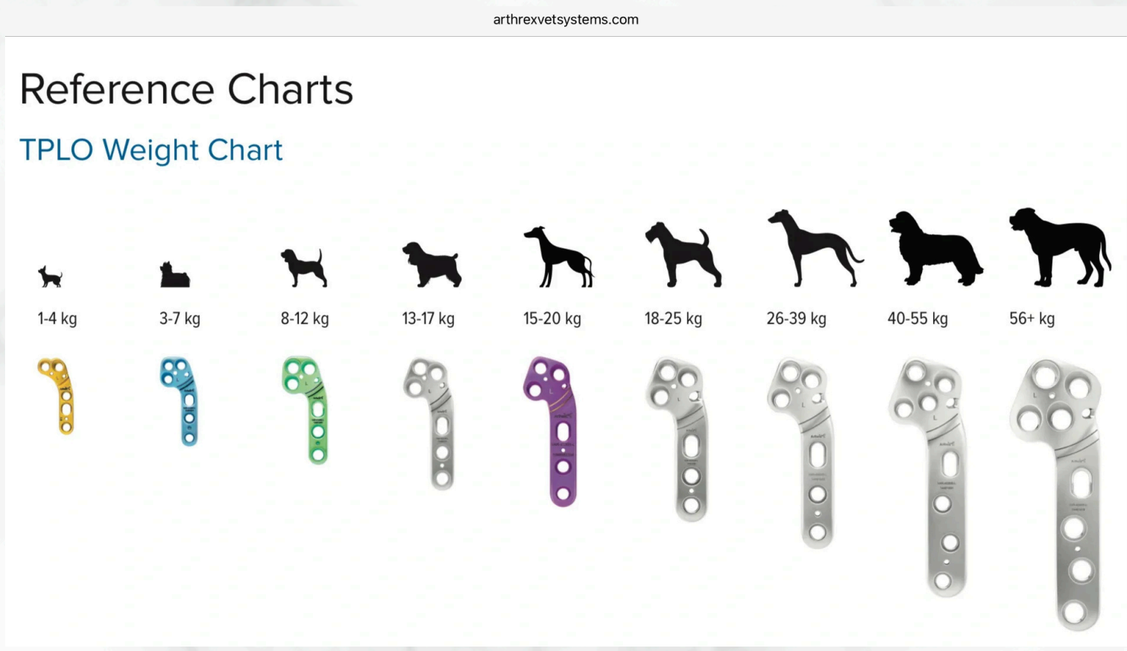

Further Info

(310) 310-3704

IF YOUR REFERRING VETERINARIAN HAS ALREADY DIAGNOSED A CCL INJURY, WE OFFER COMPLIMENTARY SURGICAL CONSULTATIONS. FOR QUALIFIED CASES, WE ALSO PROVIDE EARLY MORNING CONSULTATIONS WITH THE OPTION FOR SAME-DAY TPLO SURGERY TO STREAMLINE CARE AND MINIMIZE MULTIPLE VISITS.

OUR PRICING IS AVAILABLE BY PHONE, AND WE PROVIDE A BUNDLED SURGICAL PACKAGE SO YOU KNOW EXACTLY WHAT TO EXPECT. THE TOTAL FEE COVERS THE ENTIRE PROCESS, INCLUDING SURGERY, ANESTHESIA, HOSPITALIZATION, AND SCHEDULED RECHECK EXAMINATIONS.
